DETAILED ACTION***Allowable Subject Matter***

Claims 2, 4-11, 14-20, 22, 25-28, 30, 32-33 are allowable over the prior art of record for at least the reason that even though the prior art discloses reflective optical switches wherein a liquid crystal element is used to switch the polarization of the incident light components, the prior art fails to disclose or reasonably suggest, regarding claims 2, 4-10, an optical device comprising an output-polarization-dependent path splitting element converting the spatially-separated reflected light components having reflected angles of polarization into spatially-separated reflected-light components having output angles of polarization, thereby defining a branched output, regarding claims 11, 14-20, an optical device, wherein when the reflector is in a second one of the plurality of states, the polarization-dependent optical-path device causes at least a portion of the first and a portion of the second set of reflected-light polarization components to be out-coupled from the optical device through the second and the first output port, respectively, regarding claims 22, 25-28, an integrated optical device, wherein when the reflective element is in a second one of the plurality of states, at least a fraction of the reflected light is out-coupled through the second output port, and regarding claims 30, 32-33, a method for operating on light, wherein the polarization-dependent optical-path device includes an output-polarization-dependent path splitting element converting the spatially-separated reflected light components having reflected angles of polarization into spatially-separated reflected-light

polarization components having reflected angles of polarization, thereby defining a branched output, as set forth by the claimed combination.
